

Question 1: HR Reporting (Filtering & Sorting)

The HR department is doing a study on veteran employees. They need a list of employees matching very specific criteria. **Task:** Write a query that selects all columns from the `employees` table for employees who:

1. Are Female (' F ').
2. Were hired between January 1, 1988, and December 31, 1992.
3. Have a `first_name` that starts with the letter 'C'. *Make sure to sort the final list so the most recently hired employees appear at the very top.*

Question 2: The Finance Overview (Aggregation & DISTINCT)

The Finance Director needs a high-level summary of the company's salary structure and job roles.

Task: Write two separate queries:

1. Use the `titles` table to find out exactly how many *unique* job titles exist in the company.
2. Use the `salaries` table to calculate the Highest, Lowest, and Average salary paid by the company.

Question 3: Title Distribution (GROUP BY & HAVING)

The operations team wants to know which job titles have the most historical records, but they don't care about the rare jobs. **Task:** Using the `titles` table, group the data by the `title` column and count how many records exist for each title. However, filter your grouped results so you *only* show titles that have more than **10,000** records.

Question 4: Offboarding & Department Managers (DELETE & JOIN Teaser)

The IT department needs you to clean up a record and pull a quick manager report. **Task:**

1. **The Delete:** An employee with the `emp_no` of 10008 has left the company. Write the safe SQL command to remove only their record from the `employees` table.
2. **The Join:** We need a list of all department managers, but the `dept_manager` table doesn't have their names. Write an Equi-Join query (using a `WHERE` clause) that links the `employees` table and the `dept_manager` table to display the manager's `emp_no`, `first_name`, `last_name`, and `dept_no`.
