

## Task: Building the Delivery Fleet Database

**Scenario:** You have been hired to build the database for a new e-commerce delivery company. Read the requirements carefully and write the correct SQL queries for each step.

### Question 1: The Foundation (Concepts & DDL)

Before writing any code, the lead engineer asks you to clarify how SQL commands are categorized.

1. Briefly define DDL, DML, and DCL, and list one command that belongs to each category.
2. Write the DDL command to create a new database named `fleet_tracking` and the command to make it the active database.

### Question 2: Table Architecture (CREATE TABLE)

We need a table to store information about our delivery drivers. Think very carefully about the best data types and constraints for this information. Write the `CREATE TABLE` query for a table named `drivers` with the following requirements:

- **Driver ID:** A unique identifier for every driver that cannot be empty.
- **Full Name:** The driver's name (up to 70 characters).
- **Phone Number:** An Egyptian phone number (exactly 11 characters).
- **Vehicle Type:** Text that defaults to 'Motorcycle' if nothing else is specified.
- **Total Deliveries:** A number to track how many orders they have completed (whole numbers only).

### Question 3: Adapting to Change (ALTER TABLE)

The business requirements have just changed! We need to modify our `drivers` table without deleting it. Write the `ALTER` commands to complete the following:

1. We realized `Total Deliveries` shouldn't be negative. Add a `CHECK` constraint to ensure this number is always 0 or greater.
2. The company is expanding to use larger vans. Increase the character limit of the `Vehicle Type` column to 50 characters.
3. Add a completely new column called `hire_date` that only stores the calendar year, month, and day they were hired.

#### **Question 4: Data Entry & Modification (INSERT & UPDATE)**

Now that the structure is ready, let's add and modify some data.

1. Write an **INSERT** statement to add yourself as a new driver into the system. Provide your ID, Name, Phone Number, and Hire Date. (Let the database automatically use the default value for the Vehicle Type, and set your deliveries to 0).
2. You just completed your first 5 deliveries, and you upgraded your vehicle to a 'Sedan'. Write a single **UPDATE** statement that changes your **Vehicle Type** to 'Sedan' **AND** sets your **Total Deliveries** to 5. Make sure you use a **WHERE** clause so you don't overwrite the entire company's data!
